Abstract

This document covers the plan of testing to ensure the Pack Manager Breakout Board (PacMan BoB) will operate as intended as a unit before full system integration. Procedure for each test and criteria for passing will also be described in detail by this document.

Executive Summary

PacMan BoB Introduction
The Pack Manager (PacMan or PM) is responsible for monitoring the state of all battery cells, handling automatic charging routines, and taking necessary safety measures in the event of a system fault. The PM consists of two major components: the TS-8160-4200 Single Board Computer and the Pack Manager Breakout Board (PacMan BoB). The TS-8160-4200 is an ARM-based processor running linux. It handles most of the calculations and state transitions of the battery pack system. The second major component of the PM is the PacMan BoB. The PacMan BoB acts as the medium between the computer and the other components in the pack. The PacMan BoB will condition the 3.3V DIO pins from the TS-8160-4200 in order to allow the TS-8160-4200 to control both charging and safety loop relays. The PacMan BoB also handles the gathering of system-level data, such as temperatures within the pack fuses or AIRs, overall battery pack voltage, and pack current. In addition, the PacMan BoB contains hardware which galvanically isolates communication lines between the battery pack and the outside world. This test plan is intended to be used with the PacMan BoB only and all TS-8160-4200 signals will be simulated by the tester.
PacMan BoB Assembly and Test Plan

T000: 5V Switching Power Regulator Verification
This test will verify that the switching power regulator on the PacMan BoB will provide a constant 5V output under normal battery pack operating voltages. It will also check for any unforeseen short circuits between the positive and negative terminals of the battery pack.

Assembly:
Place and solder the following components on the PacMan BoB PCB:
- U4: MIC4680 SM 5V Switching Voltage Regulator
- L1: 68uH SM Inductor
- C1: 22uF SM Ceramic
- C2: 220uF SM Electrolytic Cap
- D2: B260A Schottky Diode
- M1: P-Channel Mosfet
- J9, J10, J14 – 0.1” pitch 2 pin screw terminal block

Additional Test Materials:
- Power Supply Capable of supplying up to 30V.
- Voltage meter or multimeter.

Test Procedure:
1. Perform test for passing criteria 1-2
2. Connect the power supply’s positive terminal to the Pack POS screw terminal (J10) and connect the power supply’s negative terminal to the Pack NEG screw terminal (J14)
3. Turn on the power supply and adjust the voltage to 5VDC
4. Perform tests for passing criteria 3 – 8.
5. Turn the power supply output off and connect the power supply’s positive terminal to the Pack NEG screw terminal and connect the power supply’s positive terminal to the Pack POS screw terminal.
7. Turn the power supply output off and disconnect its terminals from Pack POS and Pack NEG.
### Passing Criteria

</table>
**T001: Sensor Array Verification**

This test will verify that the temperature, current, and overall pack voltages can be successfully measured.

**Assembly:**

Place and solder the following components on the PacMan BoB PCB:

- U1 and U9: LTC4151 High Side Voltage Sensor
- U2, U3, U6: MCP6242 Rail to Rail Op Amp
- C3 and C4: 0.1uF Ceramic SM Capacitor
- R3: 100K SM Resistor
- R22 and R23: 2K SM Resistor
- R24: 1.5M SM Resistor
- J1, J2, J3, J4: 3 pin header
- J21: 6 pin locking header
- J11, J12, J13, J15, J16, J17, J19, J20: 2 8-pin 0.1” pitch screw terminal or 1 16-pin terminal

**Additional Test Materials:**

- 2 Power Supplies capable of supplying up to 30V.
- Voltage meter or multimeter

**Test Procedure:**

1. Connect the power supply’s positive terminal to the PACK POS screw terminal (J10) and connect the power supply’s negative terminal to the PACK NEG screw terminal (J14).
2. Turn on the power supply and adjust the voltage to 10VDC.
3. Connect power supply two’s positive terminal to pin 2 of sensor 1’s junction (J1) and its negative terminal to the pack negative terminal.
4. Turn on power supply two and adjust the voltage to 1VDC.
5. Perform tests for passing criteria 1-12.
6. Connect the I2C port on the board to the I2C adapter and send the command ___ to address 0x68 to receive the discharging current.
8. Send command ____ to address 0x68 to receive the total pack voltage via I2C.
10. Switch the SHUNT+ and SHUNT- connections and send command ____ to address 0x69 to receive the charging current.
11. Perform test for passing criteria 15.

T002: Relay Control Verification
This test will verify that relays can be triggered on and off using the TS-8160-4200 DIO pins.

Assembly:
Place and solder the following components on the PacMan BoB PCB:
- U5: M74HC07 Hex Open-Drain Buffer
- U7: 5V PCB mount SPST-NO Relay
- U13: Dual 4-input NOR gate
- U14: LTV-357T SM Optoisolator
- U15: LDA210 dual SM Darlington Optoisolator
- C5, C9: 0.1uF SM capacitor
- R1, R4, R7, R8: 10K SM Resistor
- R2, R10, R11: 1K SM Resistor
- R5: 100K SM Resistor
- R6: 6.2K SM Resistor
- R9: 5.6K SM Resistor
- Q5, Q6: 2N2222 NPN Transistor
- D5, D6, D7: D1N4148 Through-Hole Diode
- D4: 1N4001 Through-Hole Diode

Additional Test Materials:
- 3 Power Supplies capable of supplying up to 30V.
- Voltage meter or multimeter
- 2 Gigavac 24V-NO Charging relays
- 1 24VDC 210mA fan

Test Procedure:
1. Connect the power supply’s positive terminal to the PACK POS screw terminal (J10) and connect the power supply’s negative terminal to the PACK NEG screw terminal (J14)
2. Turn on the power supply and adjust the voltage to 10VDC
3. Connect the fan’s positive wire to FAN+ and its negative wire to FAN-
4. Connect charge relay 1’s positive control terminal to C RLY1+ and its negative control terminal to C RLY1-
5. Connect charge relay 1’s positive control terminal to C RLY2+ and its negative control terminal to C RLY2-
6. Connect power supply two’s positive terminal to CHRG POS and its negative terminal to CHRG NEG
7. Turn on power supply two and adjust the voltage to 24VDC
8. Perform tests for passing criteria 1-3
9. Connect power supply three’s negative terminal to Pack NEG and its positive terminal to PIN 1 of the DIO header
10. Turn on power supply three and adjust its voltage to 3.3VDC
11. Perform test for passing criteria 4-5
12. Turn off power supply three.
13. Perform test for passing criteria 6-8
14. Connect power supply three’s positive terminal to PIN 5 of the DIO Header, turn on its output, and adjust the voltage to 3.3V.
16. Turn off power supply three
17. Perform test for passing criteria 10.
18. Connect a wire between DET1 and DET2
19. Perform test for passing criteria 11-12.
20. Turn off power supply two and one.

**T003: Watchdog Timer Verification**

This test will verify the watchdog timer IC will successfully open the safety loop relay if it detects a software issue.

**Assembly:**

Place and solder the following components on the PacMan BoB PCB:
- U8: ADM1232 Watchdog Timer
- C6, C11: 0.1uF SM capacitor

**Additional Test Materials:**
- 1 Power Supply capable of supplying up to 30V.
- Voltage meter or multimeter
- Function Generator capable of providing a 3.3Vpp >1Hz square wave

**Test Procedure:**

1. Connect the power supply’s positive terminal to the PACK POS screw terminal (J10) and connect the power supply’s negative terminal to the PACK NEG screw terminal (J14).
2. Turn on the power supply and adjust the voltage to 10VDC.
3. Perform test for passing criteria 1.
4. Connect the function generator’s positive output terminal to PIN 7 of the DIO header and its negative output terminal to Pack NEG.
5. Provide a 3.3Vpp square wave running at 5Hz from the function generator with the waveform oscillating between a low voltage of 0V and a high voltage of 3.3V.
6. Perform test for passing criteria 2.
7. Turn off the output to the function generator.
8. Perform test for passing criteria 3.

**T004: RS-485 Communication Link Verification**

This test will verify the RS-485 serial communication link works correctly.

**Assembly:**
Place and solder the following components on the PacMan BoB PCB:
- U12: ADM2483 RS-232 to RS485 Isolated Transceiver
- C7, C8: 0.1uF SM capacitor

**Additional Test Materials:**
- 4 Power Supplies capable of supplying up to 30V.
- Voltage meter or multimeter
- Function Generator capable of providing a 3.3Vpp >1Hz square wave

**Test Procedure:**
1. Connect the power supply’s positive terminal to the PACK POS screw terminal (J10) and connect the power supply’s negative terminal to the PACK NEG screw terminal (J14)
2. Turn on the power supply and adjust the voltage to 10VDC
3. Connect power supply two’s positive terminal to PIN 11 on the DIO Header and its negative terminal to Pack NEG
4. Connect power supply three’s positive terminal to PIN 7 on the COM1 Header and its negative terminal to Pack NEG
5. Connect power supply four’s positive terminal to GLV_5V and its negative terminal to GLV_GND.
6. Turn on power supply two and four and adjust their voltages to 5VDC.
7. Perform test for passing criteria 1.
8. Turn on power supply three and adjust its voltage to 5VDC
10. Turn off power supply two and three. Disconnect power supply three’s positive terminal from PIN 7 of the COM1 Header and attach it to RS-485+. Disconnect power supply three’s negative terminal from Pack NEG and attach it to RS-485-.
11. Turn on power supply three and adjust its voltage to 5VDC
12. Perform test for passing criteria 3.
13. Switch the positive and negative terminal connections of power supply three. Turn on power supply three and adjust its voltage to 5VDC
